

Abstract: This monograph, an extension of earlier research, was designed to yield one revised and updated *ABVE 2004, 4 th ed. Master Exam* . All 170 test questions (TQs) including the Core test questions (N = 138) were retained from the *3rd ed. ABVE Exam* . As other test questions of reasonably equal difficulty were added to the Master Exam to cover merging test content areas, test reliability as measured by the Spearman-Brown prophesy formula increased as new TQs were added. Cronbach's alpha for the *ABVE 4 th ed. Master Exam* increased above the level of the 3rd ed. Exam. The 138 Core test questions were evenly split (using stratified random sample approach) and 69 Core TQs (along with all of the new TQs) were distributed to each of the two new *ABVE 2004, 4 th ed. Alternate Exams (Forms 1 and 2)* . Research found face, content and construct validity for all three previous editions of the ABVE Exam. In that research, standard score total test results of two cross-validation groups, one expert and one non-expert, were compared against scores of the 1998 ABVE expert norms group on the third edition of the ABVE Exam. Theoretically, all cross validation groups fit the expected model relative to the norms distribution in that research. Ongoing research was recommended to maintain and periodically revise and update the *ABVE Exam* as a valid, reliable measure of the abstract *forensic vocational, psychological and regulatory expertise* test construct, for which it was designed.
